commits on the branch	files changed	automated backend tests, all passing	browser checks, all passing	Lighthouse score, landing page

Summary. The two critical faults are fixed: WhatsApp, Instagram and Facebook messages now flow both ways in real time, and every password flow works. The whole product was rebuilt on one design system with light and dark modes. Every feature of the original shop panel and admin panel is kept, and the ones that were placeholders or hardcoded now work for real. The super admin can now see every shop's data.

1 Messaging pipeline (critical fix)

- **Incoming messages** were rejected by the database; they now save, appear in the inbox and update the unread count.
- **Replies** were saved but never sent; they now go to WhatsApp, Instagram and Facebook through one shared channel service.
- **Delivery ticks** sent → delivered → read, from Meta's status webhooks. A failed message shows "Not delivered", Meta's reason and a Retry button.
- **No duplicates** when Meta re-delivers a webhook.
- **Correct WhatsApp setup:** sends use the phone number ID, and the credentials are verified with Meta on connect.
- **Security:** every webhook is checked with `X-Hub-Signature-256`; fake requests get 401.
- **Real time** via socket.io: new messages and ticks appear without a refresh (about 0.1 s measured).

2 Password management (critical fix)

- **Change password** works and logs out every other device.
- **Forgot and reset password** work end to end. Tokens are stored hashed, expire in 60 minutes and work once.
- **New pages:** Forgot Password and Reset Password, including a clear "link expired" screen.
- **Login errors** show under the form; the page no longer reloads.
- **Abuse protection:** reset requests are rate-limited and give the same answer whether or not the email exists.
- **Minimum length** stays at 6 characters.

3 Design system and UI

- **One design system:** colour and type tokens in light and dark mode, the Inter font, and a calm, professional style instead of heavy gradients.
- **Component kit** reused everywhere: buttons, forms, tables, drawers, dialogs, badges, charts, and loading, empty and error states.
- **Responsive** at phone, tablet and desktop widths with no horizontal scroll.
- **Lighthouse:** Landing 100/100/100, Login 95/100/100, Dashboard 93–99 performance and 100 accessibility.
- **Inbox motion:** new messages slide in, a chat with a new message glows briefly, and the unread badge pulses. All of it switches off for people who turn motion off.

4 Shop owner panel

Page	What it does
App shell	Grouped sidebar, Ctrl+K search, notifications, mobile tab bar, plan card, and messages from the platform admin shown as a banner.
Dashboard	KPIs vs last week, conversion rate, revenue chart, needs-attention list, recent activity, quick actions, channel status, upgrade card, setup checklist.
Inbox	Three panels, quick replies, attachments, voice notes, product cards, customer details, tags, notes, broadcast, delivery ticks and retry.
Orders	Summary cards, status tabs, payment filter, bulk actions, detail drawer, printable invoice and CSV export. Tax type (GST, CGST+SGST, custom, none), discount and channel are calculated on the server.
Customers	Channel, tag and status filters; preset tags (VIP, High Value, First Time, Returning, Inactive, Needs Follow-up); profile with a timeline of messages and orders.
Products	Grid and table views, stock badges, drag-and-drop photos, and real product photos for the demo data.
Analytics	Today to Last year and custom ranges, CSV export, daily bar charts with headline numbers, channel splits, platform status, top products and top customers.
Settings	Profile with account stats and an email-verified badge; business details including email, phone and description; channel connection; AI replies; billing with plan features and days remaining; team; security.

Checked against the original: every feature of the old shop pages on `main` is present. The ones that were placeholders (recent activity, analytics export) now work.

5 Super admin panel

Section	What it shows and does
Overview	Shops, subscriptions, active shops, MRR and revenue, each vs the previous 30 days; quick actions; live system status; revenue chart; top shops; recent orders, chats and sign-ups.
Shops	Every shop with its real customers, orders and revenue. Add a shop, send a message, change plan or status, delete, export CSV.
Orders / Customers / Products	Every shop's records in one place, with a filter by shop.
Messages	Every shop's conversations; a chat opens as a read-only thread.
Analytics	Daily revenue, orders, sign-ups and messages; monthly growth; subscription distribution; platform usage.
Settings	Platform name and support contact (shown on the website and the billing page), admin email notifications, export all data, JSON backup without secrets, clear cache, system info, message history.
Security	Change password, two-factor login with an authenticator app, and an audit log of logins and admin actions.

6 Original admin features, now real

Original feature	Before	Now
"+12% vs last month" on cards	hardcoded	calculated vs the previous 30 days
Add User, Broadcast	buttons did nothing	create a real login; banner in every shop, plus email
Send Message to a user	fake success message	delivered to that shop's dashboard
System Status / System Info	fixed "99.9%", "v2.0.0"	live uptime, database ping, email check, version
General settings, Notifications	not saved	saved and used across the app
Export, Backup, Clear cache	did nothing	CSV files, JSON backup, real report cache
Change password	fake	real
2FA, Security audit	"Coming soon"	authenticator-app 2FA and a full audit log

7 Security improvements

- **Secrets stay on the server:** platform access tokens, passwords and 2FA secrets never reach the browser or backups.
- **2FA protection:** the code step is rate-limited, and a half-finished login can't be used as a session.
- **Proxy support:** a `TRUST_PROXY` setting makes rate limits work behind a hosting proxy.
- **Uploads** are stored in a fixed folder.

8 Other bugs fixed

- **Super Admin** got a 403 error on every page.
- **Product images** didn't save correctly.
- **Settings** saved business details to a missing route.
- **Orders:** delete didn't work, and Facebook orders were rejected.
- **Pricing:** wrong prices and trial length on the landing page and chatbot; wrong admin MRR.
- **Deleting a user** left their data behind.
- **Voice notes:** cancelling still sent the recording.
- **Admin overview** had an infinite request loop.

9 Testing and quality

- **36 automated backend tests** covering messaging, passwords, reports, admin tools, 2FA, tax and discount maths, and image upload.
- **63 browser checks:** 20 for the admin panel and 43 for the shop panel, plus end-to-end checks of the live inbox, image upload and inbox motion.
- **Code standards:** no file over 500 lines, no backup files, no hardcoded colours. `.env` and uploads are never committed.

10 Next steps (owner action)

- **Connect a real WhatsApp number:** set `META_APP_SECRET` and `WHATSAPP_VERIFY_TOKEN` in `backend/.env`, then connect it in Settings → Channels.
- **Fix email:** Gmail rejects the current login. Create a Gmail App Password and set it as `EMAIL_PASSWORD`.
- **After pulling** the branch, run `npm install` in `backend` (new 2FA packages).
- **Secure the admin account:** change the default admin password and turn on two-factor login.
- **Login page:** replace the placeholder testimonial with a real customer quote.
- **Merge:** open a pull request from `ui-update-and-fix` into `main` when ready.
- **Not yet built:** AI auto-replies and online payments.
